Tomorrow’s Digital Innovators and Entrepreneurs
Cloud Computing and Services

The programme in Cloud Computing includes electronic commerce, mobile services, online social networks, web services, and knowledge discovery. What these applications have in common is that information sources and controls are decentralised over the network and provided by one or several computing centres that offer different cloud computing service models like Infrastructure, Platform, and Software as a Service. Cloud Computing and Services provides students with a system of knowledge in formal foundations, technological platforms and practical skills in implementing cloud-based applications.

Data Science

Data abounds: social media, manufacturing systems, medical devices, and countless other sources generate petabytes of data on a daily basis. With this wealth of data, we are at a point in history where we can conduct detailed analyses to detect, discover, and, ultimately, better understand the world around us. In this programme, students learn about scalable data collection techniques, data analysis methods, and a suite of tools and technologies that address data capture, processing, storage, transfer, analysis, and visualisation.

Visual Computing

Visual Computing and Communication focuses on the acquisition, processing, analysis, transmission, and rendering of visual information, including aspects of learning and decision making. This is a perfect programme for candidates who are fascinated by the algorithms and services that handle visual information in today’s digital society. Students can be active in the areas of image processing and communication, image analysis, computer vision, computer graphics, augmented reality, visualisation, visual analytics, and web-based and network applications. They are equipped to create products and services for our ocular-centric world.

Embedded Systems

Embedded Systems focuses on enabling technologies and design methodologies for computer systems. These computer systems are embedded as integral parts of larger systems designed for specific control functions of devices with various electronic and mechanical components. More than 98 percent of the world’s processors are located in embedded systems. In satellites, robots, cars, aeroplanes, mobile telephones, radio transceivers, elevators and washing machines. They form an integral part of the Internet of Things.

Human Computer Interaction and Design

The programme focuses on study, design, development and evaluation of novel user interfaces and interactive systems which take into account human cognitive and sensory-motor responses and how these influence both technological and business requirements. The programme is interdisciplinary with courses on design and evaluation of interactive systems and a strong emphasis on user-centred design techniques. It is important to understand human responses to and consequences of using information technology as a tool for solving work-related tasks and in product development.

Internet Technology and Architecture

Internet Technology and Architecture focuses on **advanced networking** technologies and architectures for the design and management of modern, **distributed computer systems and networks**. Internet Technology and Architecture provides students with both theoretical concepts and practical tools that will develop critical thinking in assessing entrepreneurship opportunities and devising appropriate strategies to turn ideas into profitable business ventures.

Cyber Security

Cyber Security focuses on the study of the design, development and evaluation of secure computer systems, which are also capable of ensuring privacy for future ICT systems. Students learn about the future directions of the field including **blockchain technologies**, **crypto-currencies**, **practical (ethical) hacking**, and **quantum cryptography**. The programme provides an understanding of the concepts and technologies for achieving confidentiality, integrity, authenticity, and privacy protection for information processed across networks.

Autonomous Systems

Autonomous Systems combines Computer Science and Electronic Engineering to focus on **self-driving cars, robotics and artificial intelligence**. Students learn the latest theoretical knowledge and know how to apply their skills in practical real-life problems. Typical application areas of autonomous systems include autonomous vehicles, intelligent robots, industrial IoT and autonomous software systems.
